

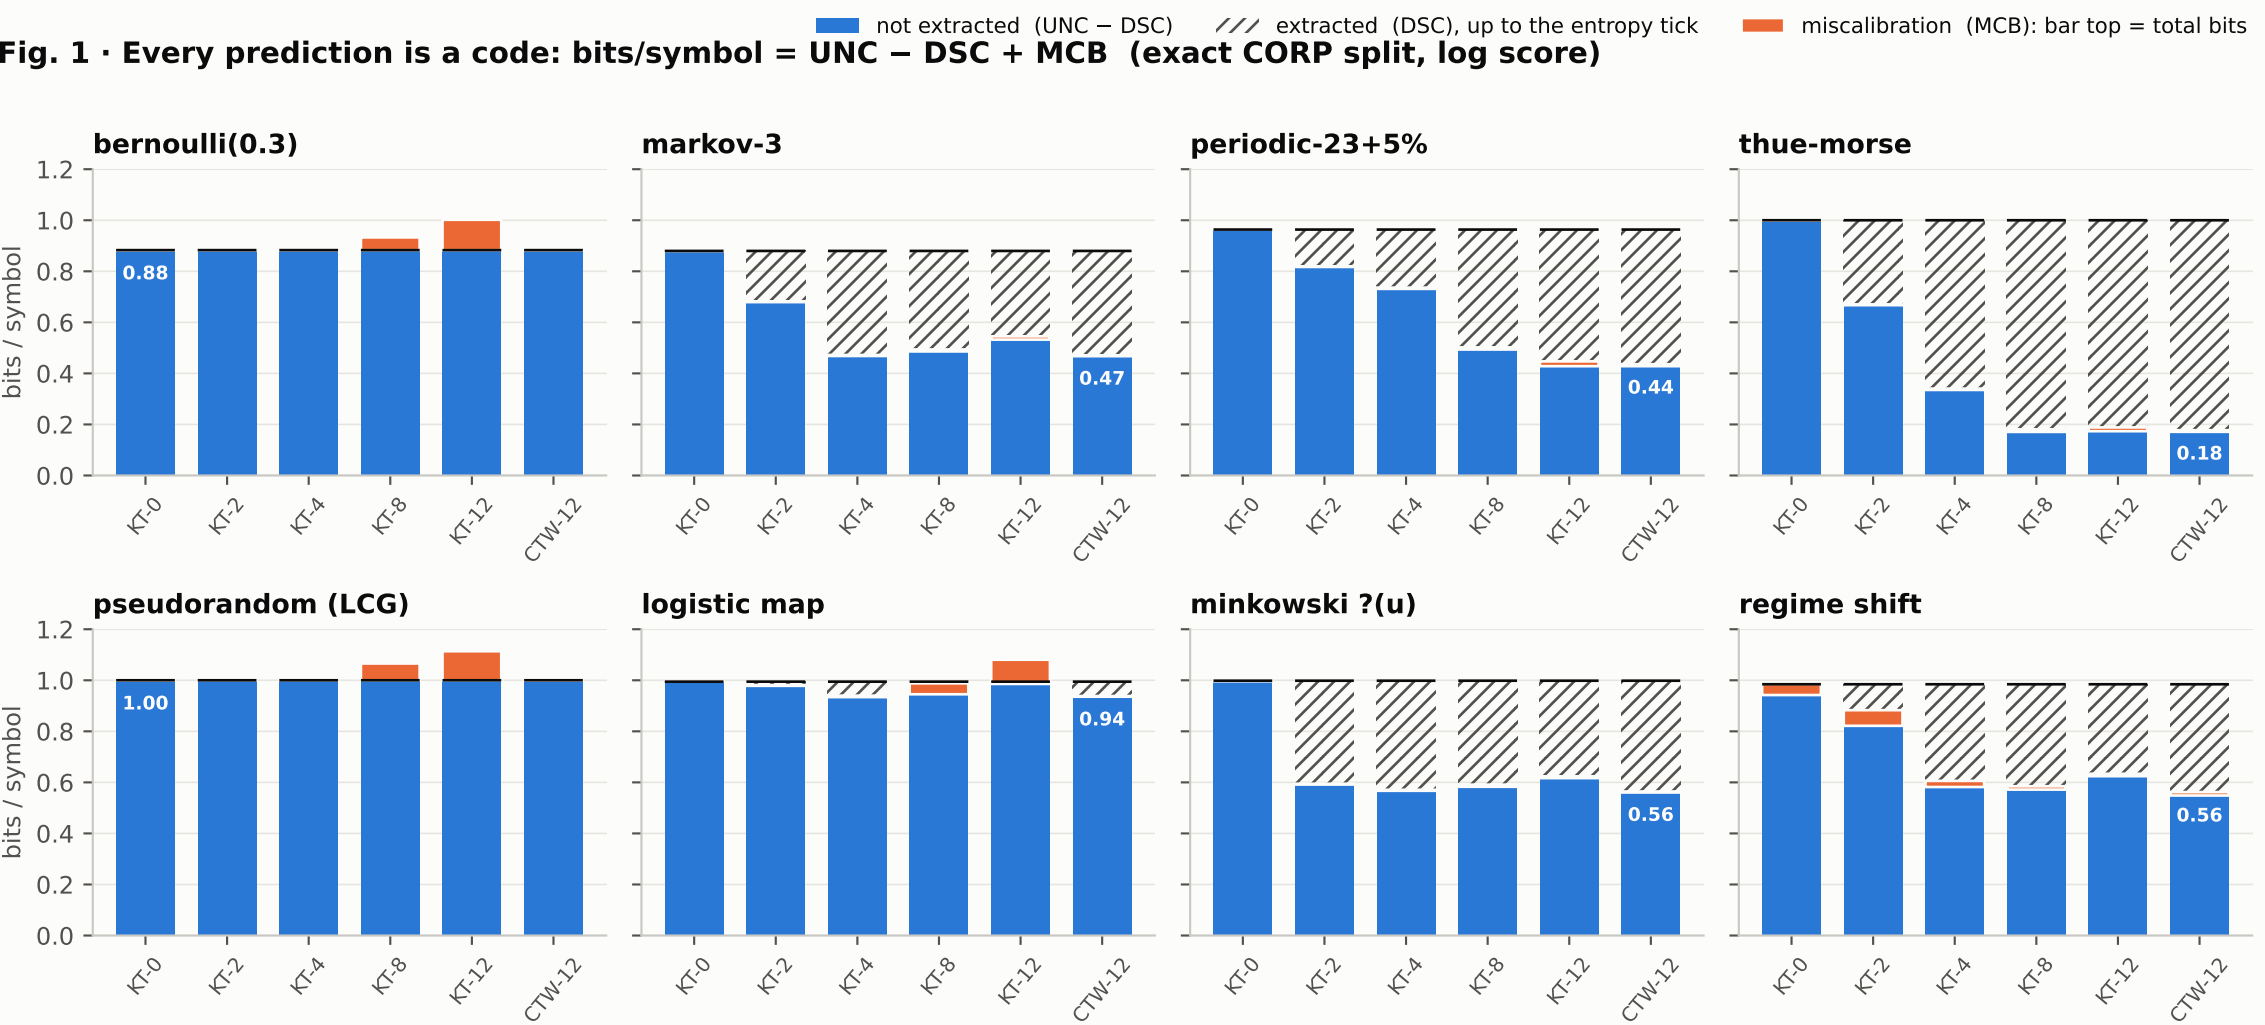

Fig. 1 · Every prediction is a code: bits/symbol = $\text{UNC} - \text{DSC} + \text{MCB}$ (exact CORP split, log score)

E001. 8 sources × compute ladder (KT order-k estimators → CTW-12, a Bayesian mixture over all context trees). Black tick = UNC (base-rate entropy); white number = best observer. Inference over structure (CTW) matches the best fixed order everywhere; over-large fixed orders pay in MCB; the pseudorandom LCG yields DSC = 0 to all bounded observers. n = 8192, 3 seeds.
